PROPOSED SOLAR PV FARM

Fawsley Estate Solar Farm

Daventry, NN11 3BA

"Solar farms typically take up less than 5% of the ground they occupy, leaving huge scope for biodiversity enhancements in a protected space"

BRE National Solar Centre Biodiversity Best Practice Guidelines 2014

Introduction

Elgin Energy EsCo Ltd is seeking to develop a ground mounted Solar PV farm at Fawsley Estate, Daventry, NN11 3BA. We are seeking your views on this proposal ahead of submitting a planning application to West Northamptonshire Council. The red line on the map below indicates the site boundary. A dedicated project website has been created to share information and to facilitate online feedback and comments via a digital version of the enclosed questionnaire.

In addition to the preceding initiatives a community consultation open day will be held between 3pm – 7pm, the 6th of September 2022, in Badby Village Hall, The Green, Daventry NN11 3AF.

Please visit <http://fawsleysolar.co.uk/> to learn more. Please note that partaking in this process does not affect your statutory rights to make representations to West Northamptonshire Council in respect of the planning application when submitted.

Project overview

The proposed site is in Fawsley Estate, Daventry, NN11 3BA. It is approximately Located 1.3km to the east of Charwelton, approximately 2.5k m west of the village of Preston Capes, and directly south of Fawsley Estate. Access to the site will be via Charwelton Road, east of Charwelton, West of Preston Capes.

The proposed project covers approximately 58 acres and will produce a maximum import capacity of 12 megawatts (MW). A project lifetime of 40 years is proposed.

The proposed solar farm will generate approximately 16,000,000 kilowatt hours (kWh) per annum powering 4600 houses or 5300 electric vehicles (EVs) every year.

Local engagement

Elgin Energy EsCo Ltd is committed to the local communities in which we operate. We engage with communities on each project through a public consultation and try to identify local initiatives that we can support through a community benefit fund.

Local contractors and businesses will be engaged as far as possible during the installation phase. It is estimated that installation will take approximately 16 weeks. For the operational phase it is envisaged that local contractors and service providers will be engaged to maintain the solar farm.

If you would like to obtain further information about a community benefit fund or enquire about providing services for this project, please visit the project website.

Pre-planning process

A number of assessments are being conducted to establish any potential affects of the proposed development on the site and surrounding lands. These reports include ecology, archaeology & cultural heritage, construction access & traffic and flood risk. In addition, a landscape and visual impact assessment has been undertaken to identify any impacts on nearby viewpoints. A glint & glare assessment is also carried out although glint & glare effects from PV panels are rare as they are designed to absorb, not reflect, sunlight. This is evidenced by the installation of PV panels adjacent to the runways at Gatwick airport.

Existing field boundaries, trees, and hedgerows will be retained as far as possible. The provision of bird boxes, insect hotels, and wildflower meadows provides significant opportunities for biodiversity enhancements. Once the solar farm is operational, sheep farming can take place ensuring the land remains in agricultural use.

Physical elements of the development

The following components are proposed for this development:

- Solar panels will be arranged in rows facing southwards at an inclination of typically 25 degrees. The distance between the rows will be between 2 - 6 metres (m). The panels are set at 0.8m above ground level and increase to [2.4 -3/3.3]m approximately.
- A mounting system comprising upright galvanised steel posts which are screwed or pushed into the ground and an aluminium support frame which is bolted together.
- Inverters measure approximately 7m x 2.5m x 3m high. They convert the DC electricity produced by the panels into grid-compatible AC current. They will be located throughout the site.
- A primary substation.
- Underground cabling from the panels/inverters to the substation
- Several permeable stone tracks to facilitate access to the inverters.
- Rural 'timber & post' deer fence measuring 2.4m in height will enclose the site. A gap of 10cm at ground level will allow ecology to freely enter and exit.
- 3m high pole-mounted CCTV cameras inside the site to monitor the solar farm.

The solar farm requires no concrete foundations except for the substation bases. It is designed to be reversible and leave no trace when removed.

About Elgin Energy

Elgin Energy is a leading solar development platform with operations in the UK, Ireland, and Australia. To date, we have delivered 21 projects / 230 megawatts (MW) including the largest operational solar farms in Scotland (13MW) and Northern Ireland (46MW).

The company's initial development began in the UK in 2011, followed by Ireland in 2015 and the Australian offices were opened in 2018.

Elgin Energy is committed to creating a sustainable future and is working towards this goal with our projects.
